

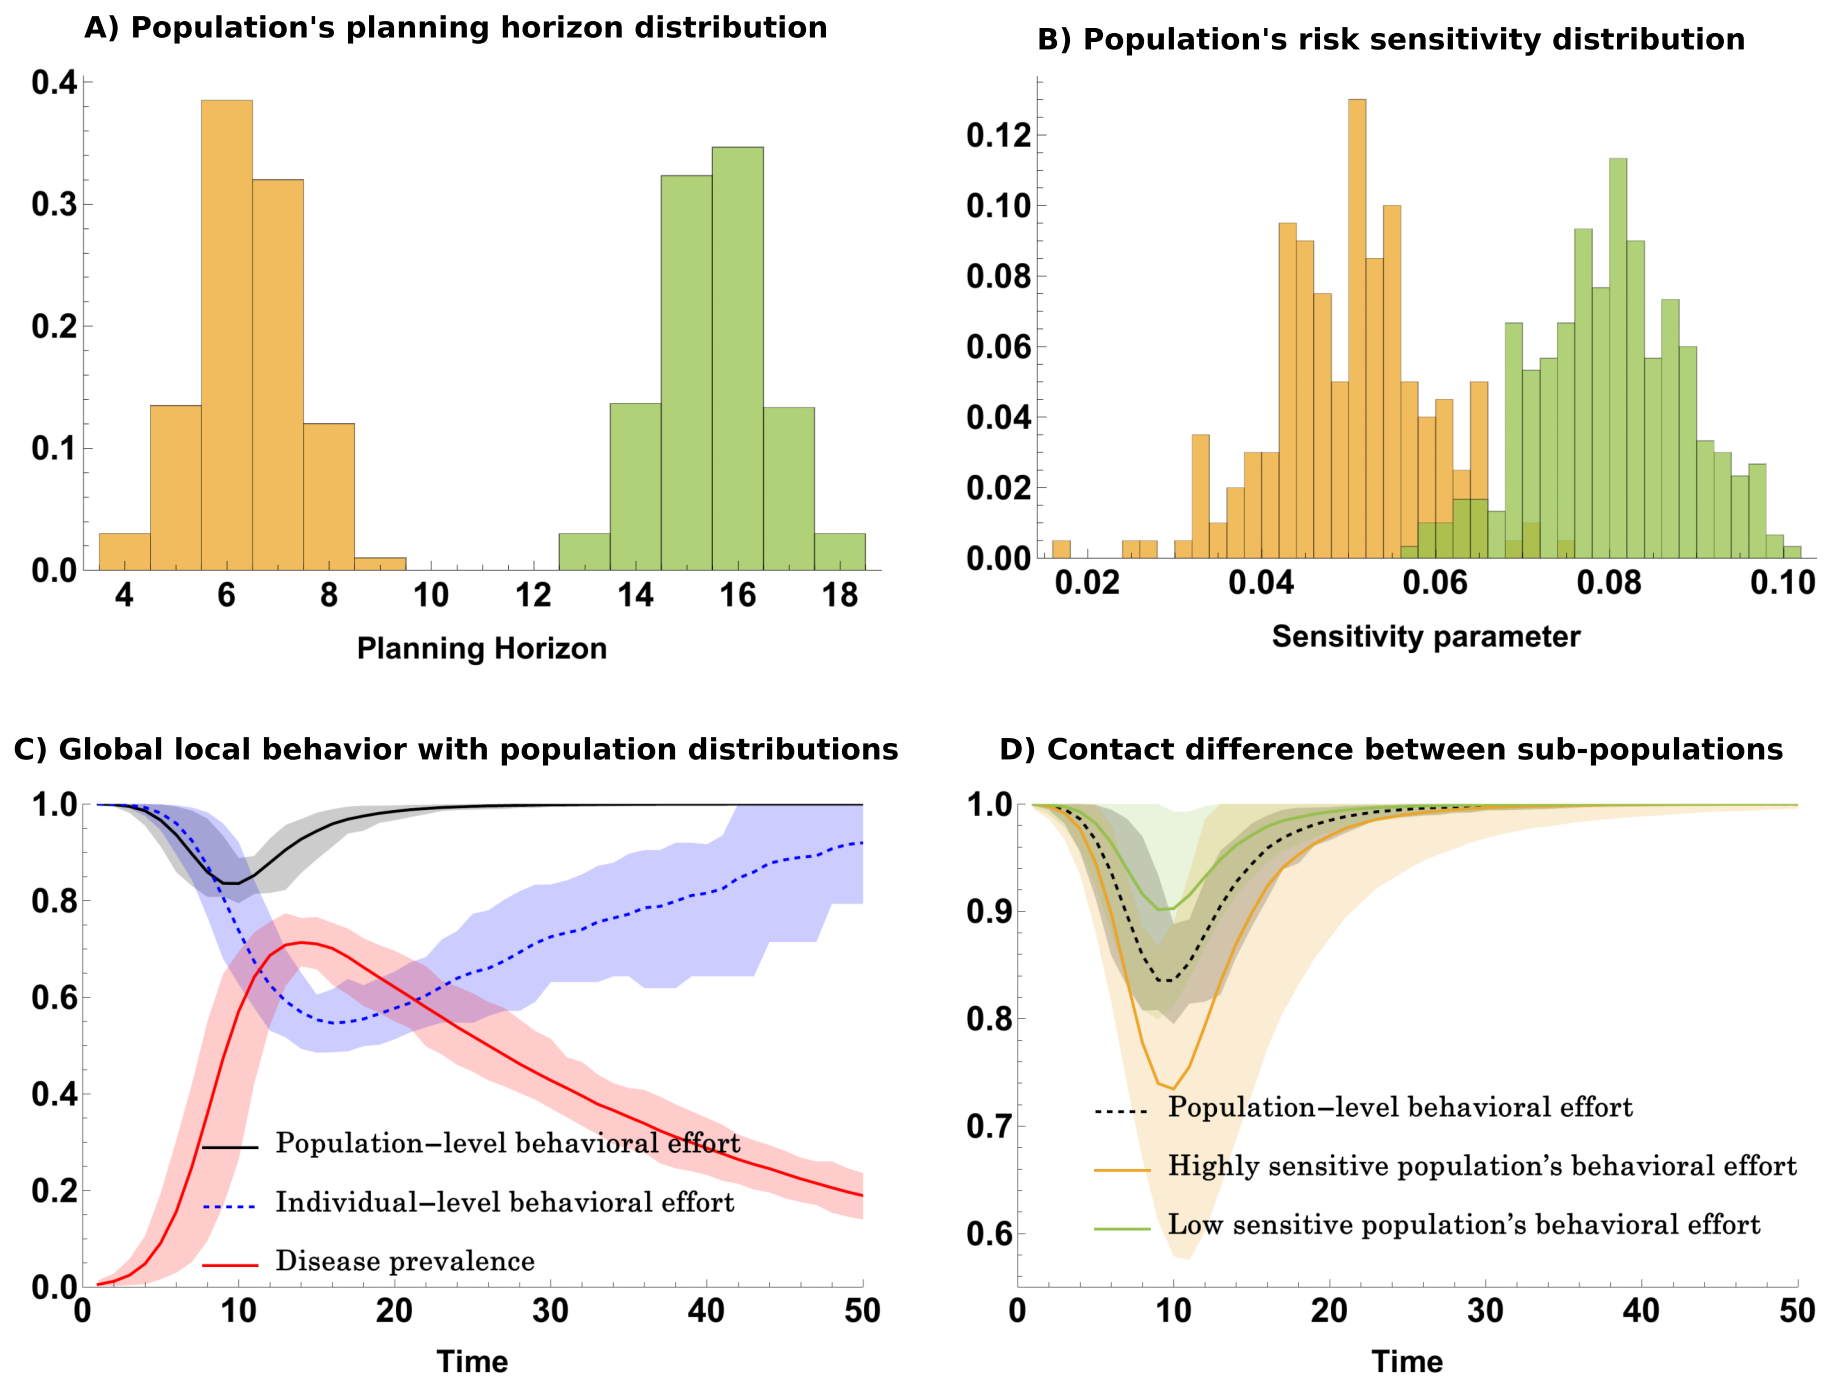

Fig. 4. (Panels A-B) Distributions of behavioral parameters for two sub-populations. In yellow, a sub-population with lower planning horizon and utility curvature parameter, representing individuals with higher sensitivity to disease progress. In green, a sub-population with higher parameter values, resulting in lower sensitivity. (Panel C) The global/local behavior effort lag persist even when heterogeneity in adaptive behavior parameters is introduced. (Panel D) Contact dynamics over the epidemic period for the high- and low-sensitivity populations, as well as the total population.
